Incedo Services GmbH backend challenge

Write a Node.js REST API application that handles the following:

- Search for an artist by name based on the following endpoint artist.search, return all the results for this artist.
- Writes the result to a user-supplied CSV filename.
- The CSV file should include the following information (name, mbid, url, image_small, image)

⇒ If no results returned from the artist.search endpoint, retrieve random artist names from a JSON dictionary source file for example:

['artistName1', 'artistName2', 'artistName3']

Repeat as necessary until you have gathered a list of artists.

Though this is a small app, please pay attention to your application structure.
Host your code on github or bitbucket and include a README with instructions on how to install and run your application.
